

# 05 Testing Build Deployment Operations

SECURAA Security Documentation

## SECURAA Secure SDLC - Testing, Build, Deployment & Operations

### Comprehensive Guide for Remaining SDLC Phases

#### Document Control

Document Title	SECURAA SDLC - Testing, Build, Deployment & Operations
Document ID	SECURAA-SDLC-005-008 (Consolidated)
Version	2.0
Date	November 13, 2025
Classification	Customer-Facing - Confidential

#### Document Overview

This consolidated document covers the remaining phases of the SECURAA Secure SDLC:

- **Phase 5: Security Testing** - SAST, DAST, Penetration Testing
- **Phase 6: Build & Deployment** - AWS CodeBuild, ECR, IAM, Container Security
- **Phase 7: Operations & Monitoring** - Production Operations, Security Monitoring

- Phase 8: CI/CD Security Pipeline - Automated Security Integration

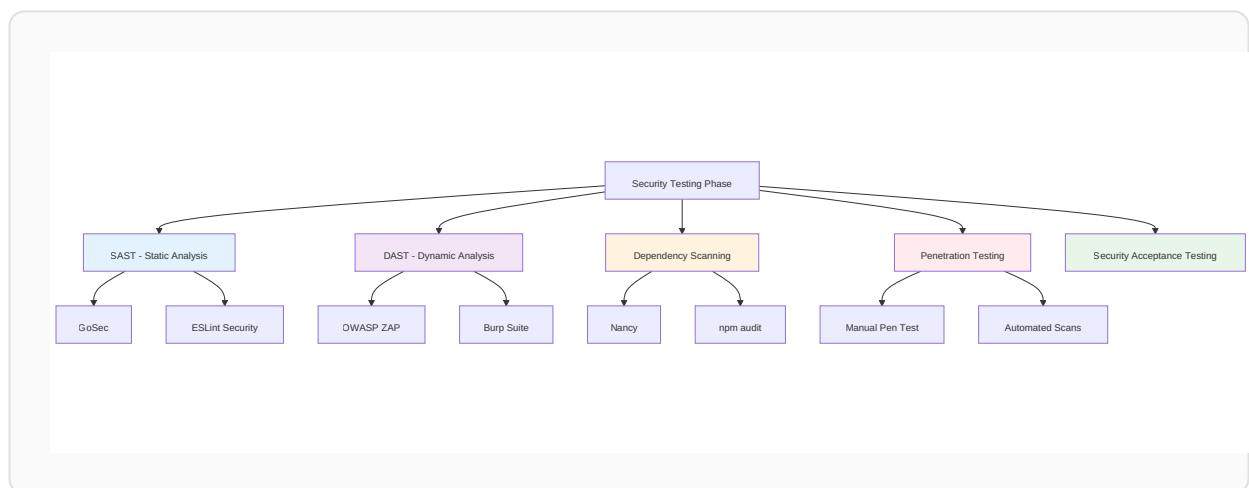

## PHASE 5: SECURITY TESTING

### Testing Phase Overview

The Security Testing Phase validates that security controls are properly implemented and effective before production deployment.

### Testing Objectives

1. **Validate Security Controls** - Verify all security requirements are met
2. **Find Vulnerabilities** - Identify security weaknesses before production
3. **Test Security Scenarios** - Validate security under various attack scenarios
4. **Verify Compliance** - Ensure compliance requirements are satisfied

### Static Application Security Testing (SAST)

#### GoSec for Go Code

##### Configuration:

```
# .gosec.yml
{
```

```

"global": {
    "nosec": false,
    "show-ignored": true,
    "confidence": "medium",
    "severity": "medium"
},
"rules": {
    "G101": {
        "description": "Look for hardcoded credentials",
        "enabled": true
    },
    "G102": {
        "description": "Bind to all interfaces",
        "enabled": true
    },
    "G103": {
        "description": "Audit unsafe block",
        "enabled": true
    },
    "G104": {
        "description": "Audit errors not checked",
        "enabled": true
    },
    "G201": {
        "description": "SQL query construction using string building",
        "enabled": true
    },
    "G401": {
        "description": "Detect MD5 usage",
        "enabled": true
    },
    "G501": {
        "description": "Import blocklist: crypto/md5",
        "enabled": true
    }
}

```

## Running GoSec:

```

# Install GoSec
go install github.com/securego/gosec/v2/cmd/gosec@latest

# Run scan on entire project
gosec -fmt=json -out=gosec-report.json ./...

# Run with specific rules
gosec -include=G101,G102,G103 ./...

```

```
# Exclude test files
gosec -exclude-dir=test ./...

# Set severity threshold
gosec -severity=high ./...
```

### Example GoSec Report:

```
{
  "Issues": [
    {
      "severity": "HIGH",
      "confidence": "HIGH",
      "rule_id": "G101",
      "details": "Potential hardcoded credentials",
      "file": "/src/config/config.go",
      "code": "password := \"hardcoded_password\"",
      "line": "45",
      "column": "12"
    },
    {
      "severity": "MEDIUM",
      "confidence": "HIGH",
      "rule_id": "G104",
      "details": "Errors unhandled",
      "file": "/src/api/handler.go",
      "code": "db.Query(sql)",
      "line": "123"
    }
  ],
  "Stats": {
    "files": 150,
    "lines": 25000,
    "nosec": 5,
    "found": 2
  }
}
```

## ESLint Security Plugin for JavaScript

### Configuration:

```
// .eslintrc.js
module.exports = {
  plugins: ['security'],
  extends: ['plugin:security/recommended'],
  rules: {
```

```
'security/detect-object-injection': 'error',
'security/detect-non-literal-regexp': 'warn',
'security/detect-unsafe-regex': 'error',
'security/detect-buffer-noassert': 'error',
'security/detect-child-process': 'warn',
'security/detect-disable-mustache-escape': 'error',
'security/detect-eval-with-expression': 'error',
'security/detect-no-csrf-before-method-override': 'error',
'security/detect-non-literal-fs-filename': 'warn',
'security/detect-non-literal-require': 'warn',
'security/detect-possible-timing-attacks': 'warn',
'security/detect-pseudoRandomBytes': 'error'
}
};
```

## Running ESLint:

```
# Install ESLint and security plugin
npm install --save-dev eslint eslint-plugin-security

# Run ESLint security scan
eslint --ext .js,.jsx src/ --format json --output-file eslint-report.json

# Run with auto-fix for some issues
eslint --ext .js,.jsx src/ --fix
```

# Dynamic Application Security Testing (DAST)

## OWASP ZAP Integration

### ZAP Configuration:

```
# zap-config.yaml
env:
  contexts:
    - name: "SECURAA Application"
      urls:
        - "https://test.securaa.io"
      includePaths:
        - "https://test.securaa.io/api/.*"
      excludePaths:
        - "https://test.securaa.io/logout"
      authentication:
        type: "form"
```

```

loginUrl: "https://test.securaa.io/login"
loginrequestData: "username=%username%&password=%password%""
usernameParameter: "username"
passwordParameter: "password"
users:
  - name: "test_user"
    credentials:
      username: "test@securaa.io"
      password: "Test123!@#"

scanners:
  passive:
    - id: 10010 # Cookie Poisoning
    - id: 10015 # Incomplete or No Cache-control
    - id: 10017 # Cross-Domain JavaScript Source File Inclusion
    - id: 10019 # Content-Type Header Missing
    - id: 10020 # X-Frame-Options Header Not Set
    - id: 10021 # X-Content-Type-Options Header Missing

  active:
    - id: 40012 # Cross Site Scripting (Reflected)
    - id: 40014 # Cross Site Scripting (Persistent)
    - id: 40016 # Cross Site Scripting (Persistent - Prime)
    - id: 40017 # Cross Site Scripting (Persistent - Spider)
    - id: 40018 # SQL Injection
    - id: 90019 # Server Side Include
    - id: 90020 # Remote OS Command Injection

```

## Running OWASP ZAP:

```

#!/bin/bash
# run-zap-scan.sh

# Start ZAP in daemon mode
docker run -d --name zap \
-p 8080:8080 \
-v $(pwd)/zap-config:/zap/config:rw \
owasp/zap2docker-stable zap.sh -daemon \
-host 0.0.0.0 -port 8080 \
-config api.key=securaa-zap-key

# Wait for ZAP to start
sleep 30

# Run spider scan
curl "http://localhost:8080/JSON/spider/action/scan/" \
--data "url=https://test.securaa.io&apikey=securaa-zap-key"

# Run active scan

```

```

curl "http://localhost:8080/JSON/ascan/action/scan/" \
--data "url=https://test.securaa.io&apikey=securaa-zap-key"

# Wait for scan to complete
while [ $(curl "http://localhost:8080/JSON/ascan/view/status/?apikey=securaa-zap-key" \
| jq '.status') -ne "100" ]; do
  echo "Scan in progress..."
  sleep 30
done

# Generate HTML report
curl "http://localhost:8080/OTHER/core/other/htmlreport/?apikey=securaa-zap-key" \
-o zap-report.html

# Generate JSON report
curl "http://localhost:8080/JSON/core/view/alerts/?apikey=securaa-zap-key" \
-o zap-report.json

# Stop ZAP
docker stop zap && docker rm zap

```

## ZAP Report Analysis:

```

# analyze-zap-results.py
import json
import sys

def analyze_zap_report(report_file):
    with open(report_file, 'r') as f:
        data = json.load(f)

    alerts = data.get('alerts', [])

    # Categorize by risk level
    critical = [a for a in alerts if a['risk'] == 'High']
    high = [a for a in alerts if a['risk'] == 'Medium']
    medium = [a for a in alerts if a['risk'] == 'Low']

    print(f"OWASP ZAP Security Scan Results")
    print(f"====")
    print(f"Total Alerts: {len(alerts)}")
    print(f"Critical (High): {len(critical)}")
    print(f"High (Medium): {len(high)}")
    print(f"Medium (Low): {len(medium)}")
    print()

    # Print critical issues
    if critical:
        print("CRITICAL ISSUES:")

```

```
for alert in critical:
    print(f" - {alert['alert']} at {alert['url']}")
    print(f"   {alert['description']}")
    print()

# Fail if critical issues found
if critical:
    sys.exit(1)

sys.exit(0)

if __name__ == "__main__":
    analyze_zap_report('zap-report.json')
```

---

## Dependency Vulnerability Scanning

---

### Nancy for Go Dependencies

```
# Install Nancy
go install github.com/sonatype-nexus-community/nancy@latest

# Scan dependencies
go list -json -m all | nancy sleuth

# Output to JSON
go list -json -m all | nancy sleuth -output json > nancy-report.json

# Set severity threshold
go list -json -m all | nancy sleuth -exclude-vulnerability CVE-2021-12345
```

### npm audit for JavaScript

```
# Run npm audit
npm audit --json > npm-audit-report.json

# Fix vulnerabilities automatically
npm audit fix

# Force fix (may introduce breaking changes)
npm audit fix --force
```

```
# Check specific package  
npm audit --package=lodash
```

## govulncheck for Go Vulnerabilities

```
# Install govulncheck  
go install golang.org/x/vuln/cmd/govulncheck@latest  
  
# Run vulnerability check  
govulncheck ./...  
  
# Output to JSON  
govulncheck -json ./... > govulncheck-report.json
```

## Penetration Testing

### Penetration Testing Scope

```
penetration_testing:  
  scope:  
    in_scope:  
      - Web application (https://test.securaa.io)  
      - API endpoints (/api/*)  
      - Authentication mechanisms  
      - Authorization controls  
      - Input validation  
      - Session management  
      - Integration endpoints  
  
    out_of_scope:  
      - Third-party services  
      - Physical security  
      - Social engineering  
      - Denial of Service testing  
      - Production systems  
  
  methodology:  
    - OWASP Testing Guide v4.2  
    - PTES (Penetration Testing Execution Standard)  
    - NIST SP 800-115  
  
  test_scenarios:  
    authentication:
```

```
- Brute force attacks
- Credential stuffing
- Session hijacking
- Token manipulation
- MFA bypass attempts

authorization:
- Privilege escalation
- Horizontal privilege escalation
- Direct object references
- Missing function level access control

injection:
- SQL injection
- NoSQL injection
- Command injection
- LDAP injection
- XPath injection

XSS:
- Reflected XSS
- Stored XSS
- DOM-based XSS
- XSS in file uploads

business_logic:
- Payment bypass
- Rate limiting bypass
- Workflow manipulation
- Price manipulation
```

## Penetration Testing Checklist

```
## Authentication Testing
- [ ] Test password policy enforcement
- [ ] Test account lockout mechanism
- [ ] Test password reset functionality
- [ ] Test remember me functionality
- [ ] Test browser cache for credentials
- [ ] Test autocomplete on password forms
- [ ] Test weak credentials (admin/admin)
- [ ] Test for username enumeration
- [ ] Test multi-factor authentication
- [ ] Test session timeout

## Authorization Testing
- [ ] Test directory traversal
- [ ] Test forced browsing
```

```
- [ ] Test privilege escalation
- [ ] Test insecure direct object references
- [ ] Test missing function level access control
- [ ] Test horizontal privilege escalation
- [ ] Test API authorization

## Input Validation Testing
- [ ] Test SQL injection (all parameters)
- [ ] Test NoSQL injection
- [ ] Test command injection
- [ ] Test LDAP injection
- [ ] Test XSS (reflected, stored, DOM)
- [ ] Test XXE injection
- [ ] Test file upload vulnerabilities
- [ ] Test buffer overflow
- [ ] Test format string vulnerabilities

## Session Management Testing
- [ ] Test session fixation
- [ ] Test session hijacking
- [ ] Test CSRF protection
- [ ] Test session timeout
- [ ] Test logout functionality
- [ ] Test concurrent sessions
- [ ] Test session token randomness

## Cryptography Testing
- [ ] Test SSL/TLS configuration
- [ ] Test weak cipher suites
- [ ] Test certificate validation
- [ ] Test sensitive data encryption
- [ ] Test password storage
- [ ] Test random number generation

## Business Logic Testing
- [ ] Test payment processing
- [ ] Test workflow bypass
- [ ] Test price manipulation
- [ ] Test quantity limits
- [ ] Test race conditions
- [ ] Test rate limiting

## API Security Testing
- [ ] Test authentication mechanisms
- [ ] Test authorization controls
- [ ] Test rate limiting
- [ ] Test input validation
- [ ] Test error handling
```

- [ ] Test API versioning
- [ ] Test CORS configuration

## Security Acceptance Testing

### Security Test Cases

Feature: Secure Authentication

Scenario: Successful login with valid credentials

Given the user has valid credentials  
When the user attempts to login  
Then the login should succeed  
And a secure session should be created  
And the login event should be logged

Scenario: Failed login with invalid credentials

Given the user has invalid credentials  
When the user attempts to login  
Then the login should fail  
And a generic error message should be displayed  
And the failed login attempt should be logged  
And no sensitive information should be exposed

Scenario: Account lockout after multiple failed attempts

Given the user has made 4 failed login attempts  
When the user makes a 5th failed login attempt  
Then the account should be locked  
And the user should be notified of the lockout  
And the security team should be alerted  
And the lockout event should be logged

Scenario: SQL injection attempt blocked

Given the user submits malicious SQL in login form  
When the system processes the input  
Then the SQL injection should be blocked  
And the user should receive an error message  
And the attack attempt should be logged  
And the input should not affect the database

Feature: Secure Data Handling

Scenario: Sensitive data encrypted at rest

Given sensitive data needs to be stored  
When the data is saved to the database

```
Then the data should be encrypted with AES-256
And the encryption key should be stored securely
And unencrypted data should never be logged
```

```
Scenario: PII data masked in logs
  Given an operation involves PII data
  When the operation is logged
  Then PII data should be masked
  And email addresses should be partially masked
  And phone numbers should be partially masked
  And credit card numbers should not appear in logs
```

## PHASE 6: BUILD & DEPLOYMENT

### AWS CodeBuild Integration

#### CodeBuild Project Configuration

```
# Core_BuildSpec.yaml (Detailed)
version: 0.2

env:
  variables:
    GO111MODULE: "on"
    GOPATH: "/go"
    ECR_REGISTRY: "665853670667.dkr.ecr.us-east-2.amazonaws.com"
    IMAGE_TAG: "latest"

  parameter-store:
    DOCKER_USERNAME: "/securaa/docker/username"
    DOCKER_PASSWORD: "/securaa/docker/password"

  secrets-manager:
    DB_PASSWORD: "securaa/prod/db:password"
    ENCRYPTION_KEY: "securaa/prod/encryption:key"

phases:
  install:
    runtime-versions:
      golang: 1.17
      nodejs: 16
      python: 3.9
```

```
commands:
  - echo "Installing dependencies..."
  - apt-get update -y
  - apt-get install -y jq unzip

  # Install security tools
  - go install github.com/securaa/gosec/v2/cmd/gosec@latest
  - go install github.com/sonatype-nexus-community/nancy@latest
  - go install golang.org/x/vuln/cmd/govulncheck@latest
  - npm install -g snyk

pre_build:
  commands:
    - echo "Pre-build phase started..."
    - echo "Current directory:" && pwd
    - echo "Listing files:" && ls -la

    # Download dependencies from internal repo
    - wget https://repo.securaa.io/github.com.zip
    - unzip -q github.com.zip -d $GOPATH/src/
    - wget https://repo.securaa.io/gopkg.in.zip
    - unzip -q gopkg.in.zip -d $GOPATH/src/

        Result: "success",
    })

    // Continue with successful login...
}

```

## Alerting Rules

```

# CloudWatch Alarms
alarms:
  high_authentication_failures:
    metric: "AuthenticationFailures"

```

```
threshold: 50
period: 300 # 5 minutes
evaluation_periods: 1
comparison_operator: "GreaterThanThreshold"
actions:
  - "arn:aws:sns:us-east-2:665853670667:security-alerts"
description: "Alert when authentication failures exceed threshold"

critical_api_errors:
  metric: "API5xxErrors"
  threshold: 100
  period: 300
  evaluation_periods: 2
  comparison_operator: "GreaterThanThreshold"
  actions:
    - "arn:aws:sns:us-east-2:665853670667:ops-alerts"
description: "Alert when API 5xx errors exceed threshold"

unauthorized_access_attempts:
  query: "fields @timestamp | filter @message like /401|403/ | stats count() as attempts"
  threshold: 30
  period: 300
  actions:
    - "arn:aws:sns:us-east-2:665853670667:security-alerts"
description: "Alert on excessive unauthorized access attempts"
```

## Incident Response

### Incident Response Plan

```
incident_response:
  severity_levels:
    critical:
      description: "Production system compromised or data breach"
      response_time: "Immediate (< 15 minutes)"
      escalation: "CISO, CTO, CEO"
      actions:
        - Activate incident response team
        - Isolate affected systems
        - Preserve evidence
        - Notify stakeholders
        - Engage external security firm if needed

    high:
```

```
description: "Security vulnerability actively exploited"
response_time: "< 1 hour"
escalation: "Security team lead, Engineering director"
actions:
  - Assess impact and scope
  - Implement containment measures
  - Deploy patches/fixes
  - Monitor for continued activity

medium:
  description: "Security vulnerability discovered"
  response_time: "< 4 hours"
  escalation: "Security team"
  actions:
    - Analyze vulnerability
    - Develop remediation plan
    - Schedule deployment
    - Update documentation

low:
  description: "Potential security issue identified"
  response_time: "< 1 business day"
  escalation: "Development team"
  actions:
    - Investigate issue
    - Assess risk
    - Create ticket for resolution

communication:
  internal:
    - Security team via Slack #security-incidents
    - Engineering team via Slack #engineering-alerts
    - Management via email and phone

  external:
    - Customers (if affected) within 72 hours
    - Regulators (if required) per compliance requirements
    - Law enforcement (if criminal activity)

documentation:
  - Incident timeline
  - Actions taken
  - Systems affected
  - Data compromised (if any)
  - Root cause analysis
  - Remediation steps
  - Lessons learned
```

# PHASE 8: CI/CD SECURITY PIPELINE

---

## Integrated Security Pipeline

```
# Complete security integration in CodeBuild
version: 0.2

phases:
  install:
    commands:
      # Install all security tools
      - ./scripts/install-security-tools.sh

  pre_build:
    commands:
      # 1. Secrets scanning
      - gitleaks detect --source . --verbose

      # 2. SAST scanning
      - gosec -fmt=json -out=gosec.json ./...
      - eslint --format json --output-file eslint.json src/

      # 3. Dependency scanning
      - go list -json -m all | nancy sleuth
      - npm audit --json > npm-audit.json

      # 4. License compliance
      - go-licenses check ./...

      # 5. Analyze results
      - python3 scripts/security-gate.py

  build:
    commands:
      # Build if security checks pass
      - make build
      - make test

  post_build:
    commands:
      # Container scanning
      - docker build -t app:latest .
      - trivy image --severity HIGH,CRITICAL app:latest

      # DAST scanning (for staging deployments)
      - |
```

```
if [ "$ENVIRONMENT" = "staging" ]; then
    ./scripts/run-dast-scan.sh
fi

# Generate security report
- ./scripts/generate-security-report.sh
```

---

## Testing Phase Exit Criteria

---

- ✓ All SAST scans completed and critical issues resolved**
- ✓ DAST scans completed with no high-risk findings**
- ✓ Dependency vulnerabilities addressed**
- ✓ Penetration testing completed (for major releases)**

- Security acceptance tests passing
- Security team sign-off obtained

## Build & Deployment Phase Exit Criteria

---

- Build completed successfully
- Container images scanned and approved
- Images pushed to ECR with proper tags
- Deployment to staging successful
- Integration tests passing
- Production deployment approved
- Health checks passing

## Operations Phase Exit Criteria

---

- Monitoring dashboards configured
  - Security alerts configured
  - Logging properly configured
  - Incident response procedures documented
  - On-call rotation established
  - Runbooks created and tested
- 

## Summary

---

This consolidated document provides comprehensive coverage of the remaining SDLC phases:

- **Testing:** Complete security testing strategy with SAST, DAST, dependency scanning, and penetration testing
- **Build & Deployment:** AWS CodeBuild integration, container security, ECR management, and secure deployment processes
- **Operations:** Security monitoring, logging, alerting, and incident response
- **CI/CD Pipeline:** Integrated security automation throughout the development pipeline

For the complete SDLC process, refer to: - [01\\_SDLC\\_Overview.md](#) - Process overview - [02\\_Requirements\\_Phase.md](#) - Security requirements - [03\\_Design\\_Phase.md](#) - Secure architecture - [04\\_Development\\_Phase.md](#) - Secure coding
